BASIC-ABSTRACT:

A drive turbine is connected through differential mechanism (6) to AC electricity generator (8), which feeds the ship consumers (9). The electricity generator current frequency is stabilised by using an electric motor connected through planetary reducer (24) to differential mechanism. The planetary reducer is provided with a splitting coupling (22) and

self-braking worm pair
(13) connected to the electric motor. The worm pair worm
(15) is rotated in
direction matching with the torque vector.

USE/ADVANTAGE - In gas turbines used in ships. Economy is
improved.
